

Endesa launches a technology transfer project for Italian electric utility A2A

The Italian company A2A (product of the merger between ASM Brescia and AEM Miláno) has contracted the services of Endesa Ingeniería for the first phase of its Technology Transfer project.

Endesa's prestige and knowledge in the field of electric power distribution coupled with its years of success in an increasingly demanding market have resulted in high demand by third parties to acquire its distribution model.

A significant technology investment along with processes and organization aimed at future needs of the sector, have been brought together in the "Elecbox" product, which after being well received in the general market was made available to customers by means of specialized services.

The contract with A2A firmly establishes Endesa as a provider of high value-add services to foreign enterprises. The company is confident that it can capitalize on this progress and continue penetrating target markets, especially in the Middle East where it is concentrating the majority of its commercial efforts.

A2A

A2A is the leading Italian municipal utility. In addition to generating and distributing electric power, it offers its clients natural gas, water cycle management, urban solid waste management, residential heating, and public lighting. In 2007 their sales reached €5.2 billion with an EBITDA of €1 billion.

③ Endesa's prestige and knowledge in the field of electric power distribution coupled with its years of success in an increasingly demanding market have resulted in high demand by third parties to acquire its distribution model.

③ This contract firmly establishes Endesa as a provider of high value-add services to foreign companies.
